Not illustrated. 1913 Excerpt: .with OF3, so that OF8 and OE, are conjugate diameters, and we can therefore draw the ellipse in a simple manner. Projecting this ellipse on Q we get OE0, the terminal E.M.F. The projection of the stator E.M.F. ellipse on Q is also shown dotted, whence the reduction in the terminal E.M.F. which we obtain by this means is made evident. The improvement in the power factor is shown indirectly also. We shall now proceed to discuss the neutralized and induced series motors (Figs. 2 and 7) in parallel columns just as we did the ordinary and inverted repulsion motors and shall show that they bear exactly the same mutual relations. The Induced Series Motor. Starting.--This machine differs only from the neutralized series motor in that the neutralizing coil is excited from the line. Let OMr (Fig. 71) be the field flux as usual, and MJg the armature and field leakage flux compounded. We suppose that the armature turns are equal to the primary turns. Set off a line OQ making an angle  $\theta = \tan^{-1} \frac{m}{n}$  with OP, as in the n neutralized motor, where n and m have the same meanings. The resultant OMfl of the field and leakage fluxes has to be balanced by that induced from the primary winding. The resultant of these two, in accordance with our rule, will be their projection on OQ, and OC X V + wi2 would also represent the secondary terminal E.M.F. to an appropriate scale if...
